

Climate Control Module Removal Instructions

Materials Needed

- Basic socket set
- Owner's manual
- Plastic Pry Set

Step 1: Remove the dash trim cover. The dash trim hides the mounting brackets for components such as the radio and the AC control module.

This will need to be removed to gain access to the AC control module.

On some vehicles this trim is able to be pried off gently with the plastic trim tools. In other vehicles, the trim may be bolted in and require removing lower dash panels and the center console.

Consult your owner's manual for the exact procedure for your make and model and remove the dash trim panel.

Step 2: Remove the mounting bolts. After the dash trim cover is removed the AC control module assembly mounting bolts should be visible.

These bolts will be removed, but do not pull the unit out quite yet.

Step 3: Disconnect the electrical connector. With the mounting bolts removed we will not pull the AC control module out.

It will only come so far and before the electrical connections will be visible. Support the AC control module while disconnecting the connectors. Take note where each connector goes and lay them in plain site.
